Best Practice - Phosphorus pentoxide Loss Tracking

Description of the Problem (Base Scenario):

Currently, the analyses of different flows are carried out, and the overall efficiency in Phosphorus pentoxide (P2O5) is monitored, but the distribution of these P2O5 losses in the different releases is not systematically quantified, reported and analysed in order to propose performances improvement measures.

Description of the Solution

We recommend, as a first step, to conduct an analytical follow-up of the various P2O5 losses (the reporting can be done within the framework of the MFCA monitoring), distinguishing between crystallized P2O5 and soluble P2O5. In a second step, and based on the results obtained over a significant period (at least 3 months), improvement measures based on the Pareto principle with evaluation of the gains and costs will have to be implemented. Those measures may be of the repulping and additional filtration type, by using the potential overcapacity of the filter presses in order to recover as much P2O5 as possible, while taking into account additional costs (electrical energy, steam consumption, consumables and staff expenses, etc.)

Best Practice - Phosphorus pentoxide Loss Tracking

Economic Gains	There is an expected gain of 1% P2O5, or 500 tP2O5/year, representing a potential saving of € 200,000
Environmental Gains	Reduction of waste (3.2%)
Health and Safety Impact	-
